

Title: Observational Insights on Urban Sleep Patterns

Abstract:

Over the course of 60 days, subjects living in high-density areas exhibited fragmented sleep cycles. Data suggests that noise levels and artificial lighting are major contributors to shorter REM sleep durations.

Summary of Findings:

- Subjects exposed to street-level noise slept 48 minutes less on average.
- Light pollution correlated with a 35% increase in night-time awakenings.
- Participants who used blackout curtains reported a 22% improvement in sleep efficiency.

Next Steps:

Deploy wearable EEG devices in Phase II for precision mapping.
